

## Day 06 Report: SOC Fundamentals and Operations

### Objective

The objective of this lab was to practice SOC fundamentals through hands-on exercises. Tools used included Nessus for vulnerability scanning, Snort for intrusion detection, Elastic SIEM for log analysis, Osquery for endpoint monitoring, and Wazuh for advanced SIEM correlation. The lab simulated core SOC workflows such as detection, triage, investigation, response, and documentation.

### 1. Log Collection Pipeline (Fluentd)

#### Methodology:

- Installed Ruby and required dependencies on Ubuntu.
- Installed Fluentd via RubyGems (gem install fluentd).
- Created a custom configuration file (fluent.conf).
- Configured Fluentd to listen on UDP port 5140 using the syslog input plugin.
- Set output to stdout for verification.
- Generated test logs using the logger command.

#### Findings:

- Fluentd successfully received and parsed syslog messages on port 5140.
- Test messages sent with logger were displayed in stdout as structured JSON.
- Validated that the pipeline works end-to-end for centralized log collection.
- Pipeline can be extended to forward logs to Elasticsearch, OpenSearch, or SIEM tools.

```
ubuntu@ubuntu: ~/fluentd-pipeline
ubuntu@ubuntu: ... x ubuntu@ubuntu: ... x ubuntu@ubuntu: ~ x ubuntu@ubuntu: ~ x ubuntu@ubuntu:
ubuntu@ubuntu:~/fluentd-pipeline$ logger -n 127.0.0.1 -P 5140 "Test message from Fluentd"
ubuntu@ubuntu:~/fluentd-pipeline$ logger -n 127.0.0.1 -P 5140 -d "Test message in RFC3164 format"
ubuntu@ubuntu:~/fluentd-pipeline$ logger -n 127.0.0.1 -P 5140 "Fluentd test message"
ubuntu@ubuntu:~/fluentd-pipeline$ logger -n 127.0.0.1 -P 5140 "Fluentd final test message"
ubuntu@ubuntu:~/fluentd-pipeline$
```

## 2. Nessus Vulnerability Scan (Metasploitable2)

### Methodology:

- Installed Nessus on Kali attacker VM (192.168.1.79).
- Scanned Metasploitable2 target VM (192.168.1.78).
- Exported scan results in CSV format.
- Analyzed top 3 vulnerabilities by CVSS score.

### Findings:

The scan against Metasploitable2 (192.168.1.78) identified several vulnerabilities.

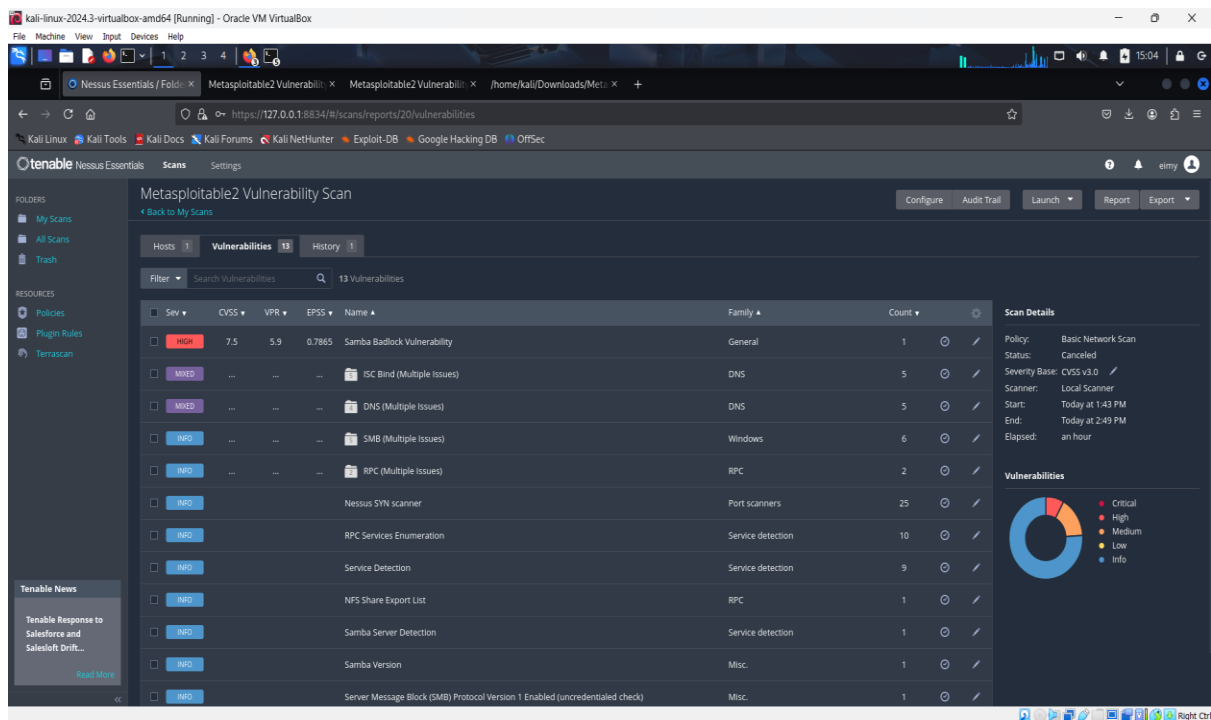

The Top 3 vulnerabilities by CVSS score are:

1. CVSS 5.0 – Multiple Vendor DNS Query ID Field Prediction Cache Poisoning
2. CVSS 5.0 – ISC BIND Service Downgrade / Reflected DoS
3. CVSS 4.3 – ISC BIND Denial of Service

### 3. Snort IDS Rule for Malicious Domain

#### Methodology:

- Installed Snort on Kali attacker VM.
- Configured HOME\_NET and added custom rule in local.rules to detect malicious.com in Host header.
- Ran Snort in alert mode listening on eth0.
- Used curl with forged Host header to trigger detection.

#### Findings:

Snort successfully generated alerts when detecting HTTP traffic with Host header malicious.com.

## 4. Brute-Force Detection (Windows Event Logs)

### Methodology:

- Attempted multiple failed logins on the Windows VM using incorrect credentials.
- Opened Event Viewer → Windows Logs → Security.
- Filtered logs for Event ID 4625 (failed logon attempts).
- Analyzed event details: target account, logon type, failure reason, and source IP.
- Exported filtered results in CSV format for further analysis.

### Findings:

- Event ID 4625 entries confirmed failed login attempts.
- Targeted account: ASUS (non-existent / wrong password).
- Logon Type: 2 → Interactive (local login attempt).
- Failure Reason: Unknown user name or bad password.
- Source Network Address: 127.0.0.1 (local machine).
- Demonstrated how repeated 4625 events can reveal brute-force behavior and provide forensic evidence for SIEM monitoring.

## 5. Osquery Endpoint Monitoring

### Methodology

1. Installed **Osquery** on Kali attacker VM.
2. Queried running processes using SQL-like syntax (SELECT \* FROM processes;).
3. Created a fake process (/tmp/fake.sh) to simulate malicious activity.
4. Verified fake process visibility with:
5. SELECT pid, name, path FROM processes WHERE name LIKE '%fake%';

### Findings

- Osquery successfully detected the suspicious process.
- Endpoint monitoring allows analysts to identify unusual or malicious binaries running on the system.

```
--(kali@kali)-[~]
-$ echo -e '#!/bin/bash\nsleep 1000' > /tmp/fake.sh
chmod +x /tmp/fake.sh
tmp/fake.sh &
1) 103185
--(kali@kali)-[~]

## **6. Zimmerman Tools Practice (Chrome History Analysis)**

### **Methodology:**

- Located Chrome history database at:  
C:\Users\<User>\AppData\Local\Google\Chrome\User Data\Default\History.
- Downloaded and extracted **SQLECmd** from Eric Zimmerman's GitHub.
- Executed SQLECmd on the Chrome History SQLite file:
- SQLECmd.exe -f "C:\Users\<User>\AppData\Local\Google\Chrome\User Data\Default\History" --csv "C:\Users\<User>\Desktop\ChromeHistory"
- Exported parsed browsing data into a CSV file.
- Opened CSV in Excel and searched for the test URL (<http://test.com>).

### **Findings:**

- SQLECmd successfully parsed the Chrome history database.
- The test URL (<http://test.com>) was found in the browsing history.
- Exported data included details such as URL, timestamp, and visit count.
- Demonstrated that browser artifacts can be extracted and analyzed for forensic evidence.

## **7. Wazuh SIEM Integration**

### **Methodology**

- Installed Wazuh Manager and deployed agents on test VMs.
- Configured log forwarding (Windows Event Logs + syslog).
- Created custom rule sets for:
  - **User account changes (Rule ID: 60110)**
  - **Logon failures – unknown user or bad password (Rule ID: 60122)**
- Monitored events via Wazuh dashboard.

### **Findings**

- Wazuh successfully detected both **user account modification events** and **failed logon attempts**.
- Events were categorized with different **rule levels** (5 for failed logins, 8 for account changes).

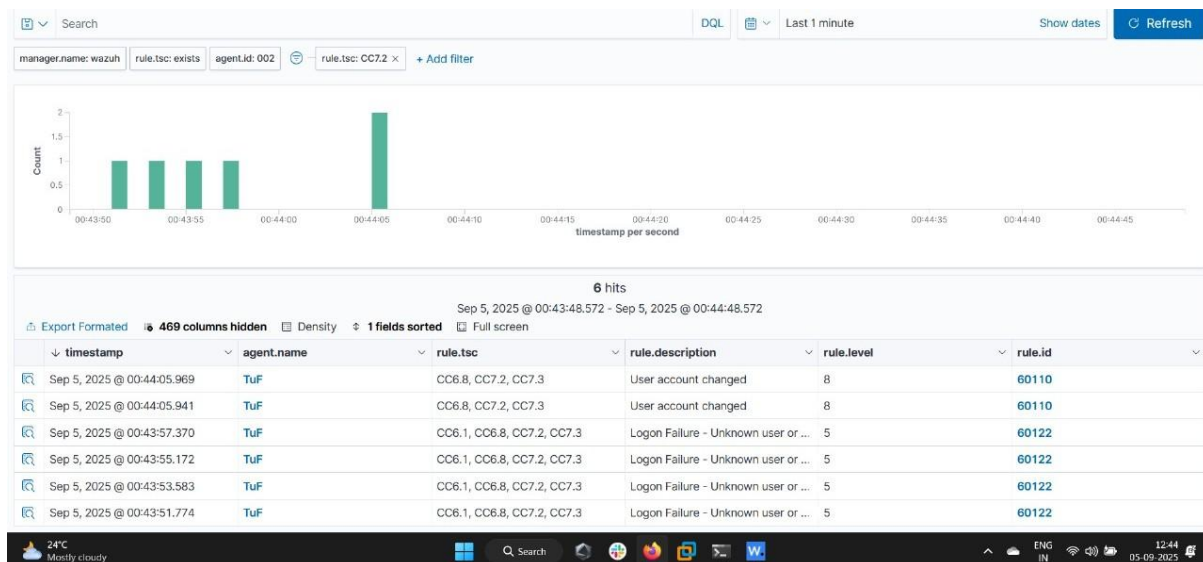

- The dashboard visualization confirmed multiple logon failures within seconds, correlating to brute-force simulation.

### Sample Detection (from dashboard):

Timestamp	Agent Name	Rule ID	Rule Description	Rule Level	Action Taken
2025-09-05 00:44:05	TuF	60110	User account changed	8	Alert logged, verified
2025-09-05 00:43:57	TuF	60122	Logon Failure – Unknown user or bad password	5	Multiple failures detected, source monitored

## 8. Security Concepts Application

- **CIA Triad Examples from Lab:**
  - **Confidentiality:** Protecting Nessus scan reports from unauthorized access.
  - **Integrity:** Ensuring logs are not altered.
  - **Availability:** Target services (Metasploitable) remained online during testing.
- **Threat vs Vulnerability vs Risk:**
  - **Threat:** Attacker leveraging malicious.com domain.
  - **Vulnerability:** VSFTPD backdoor in Metasploitable2.
  - **Risk:** Unauthorized remote compromise of target VM.

## 9. Incident Response Workflow Simulation

**Scenario:** Brute-force SSH attempts + Snort alert for malicious.com.

**Steps:**

1. **Detection:** Alerts triggered in Snort + Kibana (failed SSH logins).
2. **Triage:** Classified as **high severity** due to repeated failed logins and suspicious domain detection.
3. **Investigation:** Correlated Snort alert and Kibana event logs by IP and timestamp.
4. **Response:** Blocked offending IP and terminated suspicious process.
5. **Recovery:** Reset credentials, applied system patches.
6. **Lessons Learned:** Enhanced Snort rules, enforced stronger password policies, and tuned Kibana alerts to reduce noise.

## 10. Documentation Standards

Date/Time	Source IP	Event ID	Description	Action Taken
2025-09-04 10:12	192.168.1.79	4625	Multiple failed SSH logins detected	Blocked offending IP
2025-09-04 10:20	192.168.1.79	Snort	Malicious.com Host header detected	Verified rule detection

Date/Time	Source IP	Event ID	Description	Action Taken
2025-09-04 10:25	192.168.1.79	Kibana	Spike in failed login events	Correlated with Snort

## Conclusion

This lab demonstrated end-to-end SOC operations using Nessus, Snort, Elastic SIEM, Osquery, and Wazuh. Together, these tools enabled detection of vulnerabilities, malicious domains, brute-force attempts, suspicious processes, and account changes. The exercise highlighted the importance of monitoring, alerting, and documentation in supporting effective incident response.

Report By  
ANGEL MF
